Confirmation of Hygiene Performance

We hereby confirm that **MEIKO** commercial dishwashing machines are within the scope of EN 17735:2022-12 „Commercial dishwashing machines - Hygiene requirements and testing“ and they fulfil all applicable hygiene requirements.

MEIKO commercial dishwashing machines are also in compliance with the supplementary requirements defined by DIN 10544:2024-07 “Food Hygiene – Commercial dishwashing machines – Additional hygiene requirements and testing”.

The standards define batch dishwashing machines like undercounter or hood-type machines to be type tested directly by the manufacturer. In contrast to this, commercial flight conveyor dishwashing machines shall be tested after the installation by the operating company. This is based on the fact, that the results must refer to the customised machine under real practical conditions.

Nevertheless, **MEIKO** performed internal pre-compliance analysis with various conveyor type machines based on a worst-case approach and has always achieved the required minimum hygiene performance, a washing result (bacterial reduction) of ≥ 5-$\log_{10}$ levels.

If installed and configured in accordance with the instructions, including the recommended type and dosage of treating agents such as detergent and rinse aid, it can be assumed with a high degree of certainty that the washing results will meet all the requirements defined by EN 17735 as well as DIN 10544.
